

ABSTRACT

The present invention relates to a container comprising an edge delimiting an aperture and a rigid protective element arranged in a removable manner supported on said edge, said protective element comprising a gripping element centered on an outer surface of the protective element, said gripping element being of elongated form along an Y axis, said protective element comprising means arranged along the Y axis and/or an axis perpendicular to the Y axis and, at the time of a movement of the protective element intended to separate it from said edge, suitable for forming a tear to break the seal, in such a manner as to facilitate its removal.
